Kingfisher AI Hackathon | April 2026

AI-Powered JD-to-Resume Screening Copilot

Retail technology programs often struggle to screen candidates quickly for niche engineering roles: SRE, cloud engineer, POS specialist, SAP integration engineer, React checkout engineer. Manual screening is inconsistent, slow, and difficult to justify to candidates or hiring panels — especially when the same technical skill appears under a dozen different names across resumes.

WHY THIS PROJECT?

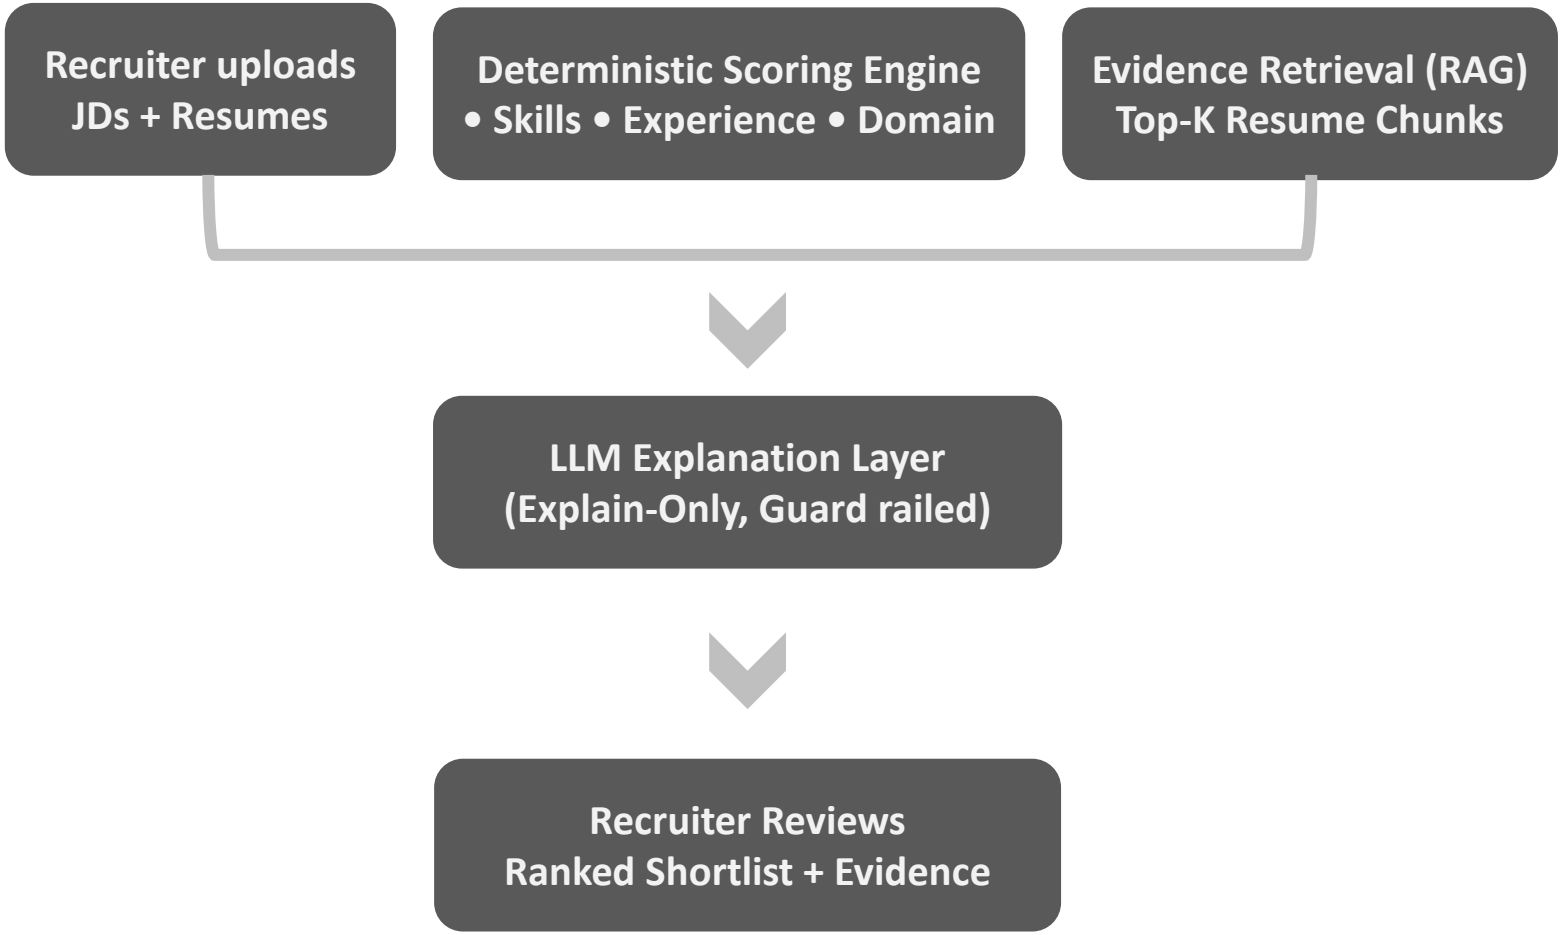
- Enhancing recruitment efficiency through intelligent automation
- The Problem: Manual Screening at Scale
  - Complex Resume Variations
  - Time-Consuming Screening
  - Inconsistent Outcomes

WHAT TalentFit Offer

- TalentFit Assist serves as an AI copilot that enhances recruiter decisions without replacing human judgment.
- Designed for complex engineering and niche retail technology positions, addressing specialized recruitment needs.
- Emphasizes precision, transparency, and responsible AI to provide explainable evidence supporting hiring decisions.

How It Works

End-to-End Architecture



Deterministic Scoring Engine

The scoring engine evaluates candidates using weighted attributes in a fully deterministic process ensuring consistent results.

Evidence Retrieval Layer

This layer employs retrieval-augmented generation to select resume sections most relevant to the job description.

Language Model Explanation

The language model generates cited summaries, highlights gaps, and suggests interview questions under ethical guardrails.

Human Decision-Making

Recruiters review ranked shortlists and evidence to make final hiring decisions, ensuring ethical responsibility.
